CONFIGURATION INFORMATION

Benchmark Configuration and Tested Storage Configuration

The following diagram illustrates the Benchmark Configuration (BC), including the Tested Storage Configuration (TSC) and the Host System(s).
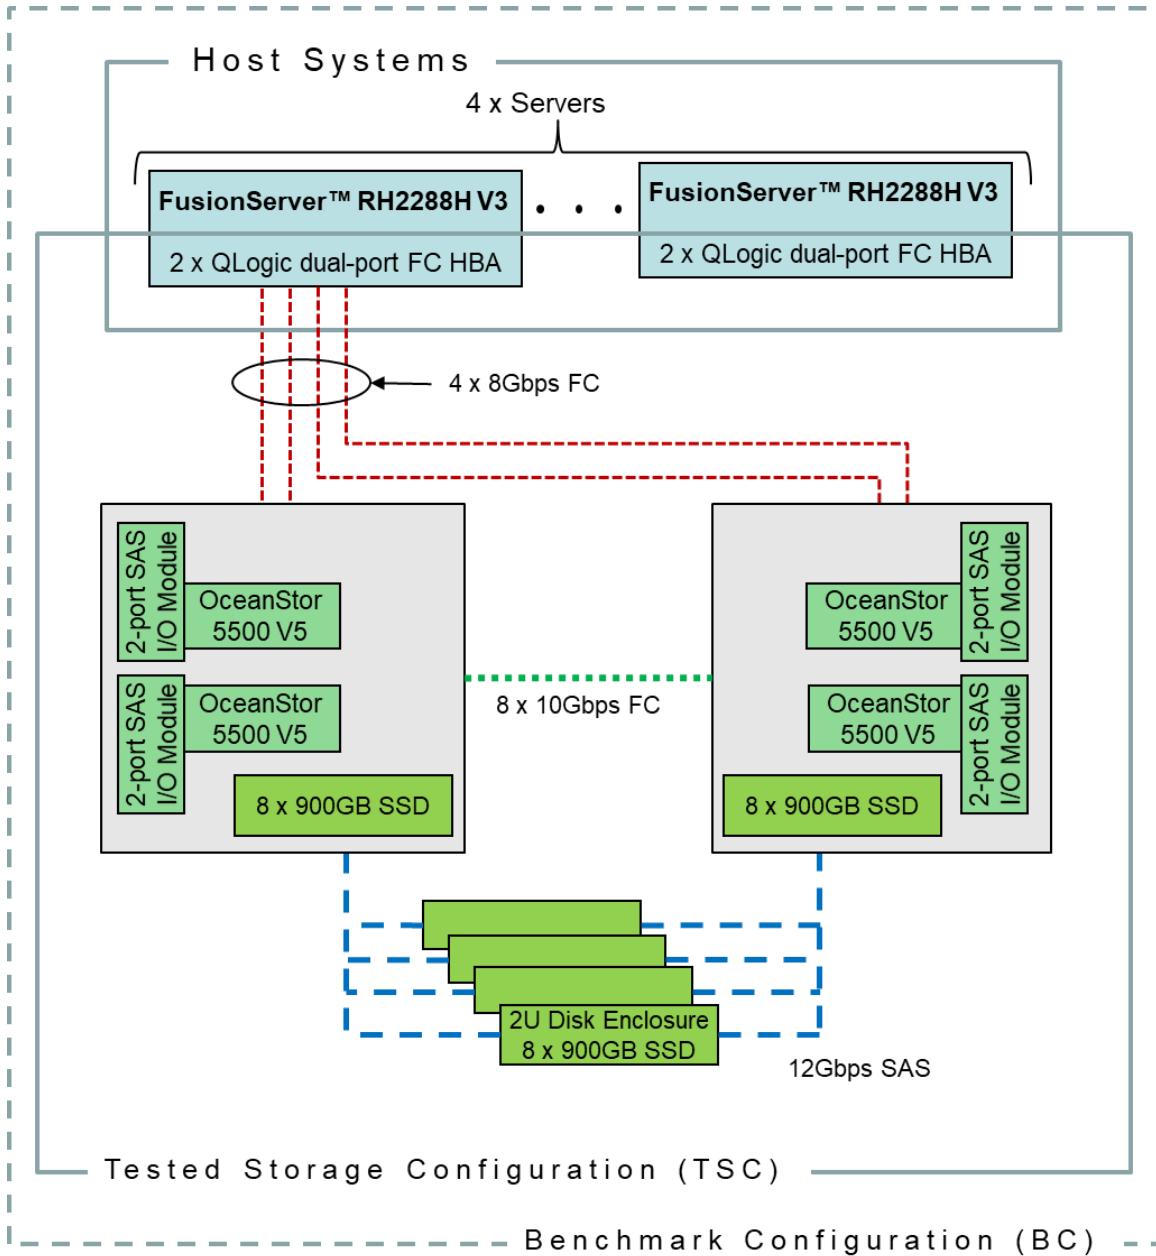

Storage Network Configuration

The Tested Storage Configuration (TSC) involved an external storage subsystem made of 4 Huawei OceanStor 5500 V5, driven by 4 host systems (Huawei FusionServer RH2288H V3). The OceanStor controllers were grouped in sets of 2, forming 2 OceanStor Engines. Each FusionServer host system connected one-to-one to each OceanStor Engine. That connection was established via a port from 1 of the 2 dual-port Fibre Chanel HBAs on the FusionServer; and a port from 1 of the 4 4-port Smart I/O Modules on the OceanStor Engine, leaving 12 of these ports inactive in each Engine. These Fibre Chanel paths operated at 8Gbps.

Host System and Tested Storage Configuration Components

The following table lists the components of the Host System(s) and the Tested Storage Configuration (TSC).

Host Systems
4 x Huawei FusionServer™ RH2288H V3
2 x Intel® Xeon® E5-2667 v4 (3.2 GHz, 8 Cores, 25 MB L3)
128 GB Main Memory

     4 x 4-port 8Gbps Smart I/O Modules
     4 x 4-port 10Gbps Smart I/O Modules
     4 x 2-port 12Gbps SAS I/O Modules

- **SPC1_PERSIST_1_0_Raw_Results.xlsx**
- **SPC1_PERSIST_2_0_Raw_Results.xlsx**

Data Persistence Test Execution

The Data Persistence Test was executed using the following sequence of steps:

- The PERSIST_1_0 Test Phase was executed to completion.
- The Benchmark Configuration was taken through an orderly shutdown process and powered off.
- The Benchmark Configuration was powered on and taken through an orderly startup process.
- The PERSIST_2_0 Test Phase was executed to completion.

Data Persistence Test Results

Data Persistence Test Phase: Persist1	
Total Number of Logical Blocks Written	123,285,725
Total Number of Logical Blocks Verified	68,665,991
Total Number of Logical Blocks Overwritten	54,619,734
Total Number of Logical Blocks that Failed Verification	0
Time Duration for Writing Test Logical Blocks (sec.)	601
Size in bytes of each Logical Block	8,192
Number of Failed I/O Requests in the process of the Test	0

Committed Data Persistence Implementation

The persistency of committed data is implemented at two levels. At the disk level, data loss is prevented through the use of RAID 10 arrays. At the controller level, all caches are mirrored across controllers, where write requests are only completed once the local cache has been successfully mirrored in another controller's cache. In addition, cache content is protected from a loss of power by flushing the cache content to permanent flash memory, as soon as a power loss is detected. The flushing action is powered by a battery backup located in each controller.

APPENDIX E: CONFIGURATION INVENTORY

An inventory of the Tested Storage Configuration was collected during the execution the script *full_run.sh.* It generated the following log file:

- ***profile1_volume.log***   List of configured volumes before the INIT Phase.
- ***profile1_storage.log***   List of configured storage before the INIT Phase.
- ***Profile2_volume.log***   List of configured volumes after TSC restart.
- ***Profile2_storage.log***   List of configured storage after TSC restart.

The above log files are included in the Supporting Files (see Appendix A).

APPENDIX F: WORKLOAD GENERATOR

The ASUs accessed by the SPC-1 workload generator, are defined using the script **slave_asu.asu**.

The phases of the benchmark are executed using the script **full_run.sh**. The script pauses at the end of the PERSIST_1 test phase. Once the TSC has been restarted, the PERSIST_2 test phase is executed by pressing ENTER from the console where the script has been invoked.

The above scripts are included in the Supporting Files (see Appendix A) and listed below.
